# Septic shock – High mortality & Cognitive decline

Table 2. Random Effects Meta-Analysis by Septic Shock Criteria Groups

#### Key messages

- More than half of sepsis survivors have long-term cognitive impairment
- Cerebrovascular damage, metabolic disorders, and brain inflammation are hallmarks of sepsis and precede cognitive impairment
- Brain changes during sepsis mainly include disruption of the blood-brain barrier, microglial activation, and altered neurotransmission; these lesions can be diffuse and often target the limbic system, specifically the hippocampus
- Appropriate management of the acute phase of sepsis—eg, following the Surviving Sepsis Campaign guidelines, can prevent cognitive impairment
- No specific treatment is available; future treatment might target the blood-brain barrier, microglial cell activation, or neurotransmission

#### Lilly Announces Withdrawal of Xigris® Following Recent Clinical Trial Results

INDIANAPOLIS, October 25, 2011 /PRNewswire/ --

Eli Lilly and Company announces withdrawal of its Xigris(R) [drotrecogin alfa (activated)] product in all markets following results of the PROWESS-SHOCK study, which showed the study did not meet the primary endpoint of a statistically significant reduction in 28-day all-cause mortality in patients with septic shock. The company is working with regulatory agencies on this withdrawal, and is in the process of notifying health care professionals and clinical trial investigators.

"While there were no new safety findings, the study failed to demonstrate that Xigris improved patient survival and thus calls into question the benefit-risk profile of Xigris and its continued use," said Timothy Garnett, M.D., Lilly's Senior Vice President and Chief Medical Officer. "Patients currently receiving treatment with Xigris should have treatment discontinued, and Xigris treatment should not be initiated for new patients."

Anticoagulants, brisk variations in blood

pressure, high dose of vasopressors

## HPA axis in sepsis and septic shock

TABLE 1 | Mechanism explaining hypothalamic-pituitary-adrenal axisdisruption in sepsis.

disruption in se	epsis.			Hornormago	Coagulopathy, severe hypoxia
HPA axis level	Main mechanisms	Precipitating factors		Decreased	
Hypothalamus	Necrosis or hemorrhage	Anticoagulants, brisk variations in blood pressure, high dose of vasopressors Coagulopathy, severe hypoxia, hyperglycemia		steroidogenesis Depletion of lipid droplets Decreased expression of	Cholesterol-lowering drugs Proinflammatory mediators
	Decreased CRH/AVP synthesis/release	Treatment with corticosteroids, psychoactive drugs Increased brain levels of proinflammatory cytokines (mainly TNF and IL-1) Hypercortisolemia		scavenger receptor B1 Enzymes inhibition	Aminoglutethimide, ketoconazole, fluconazole, etomidate, dexmedetomidine Proinflammatory mediators
Pituitary gland	Necrosis or hemorrhage	Anticoagulants, brisk variations in blood pressure, high dose of vasopressors Coagulopathy, severe hypoxia,		Decreased sensitivity of ACTH receptors	Circulating and adrenals proinflammatory mediators (e.g., corticostatins)
	Decreased ACTH synthesis/release	hyperglycemia Treatment with corticosteroids, psychoactive drugs, anti- infective drugs, megestrol acetate medroxyprogesterone Increased blood levels of proinflammatory cytokines (mainly TNF and IL-1) Coagulopathy, severe hypoxia,	Tissue resistances	Decreased cortisol delivery to tissues Accelerated glucose clearance Decreased binding capacity and affinity of glucocorticoid receptor	Proinflammatory mediators, liver failure, severe denutrition Phenobarbital, phenytoin, rifampin Proinflammatory mediators
		hypercortisolemia	HPA, hypothala	mic–pituitary–adrenal.

Dose per day	Hydrocortisone 200 mg Fludrocortisone 50 µg	200 mg	Hydrocortisone 200 mg Fludrocortisone 50 µg	200 mg
Route of administration	Hydrocortisone: four intravenous bolus of 50 mg Fludrocortisone: 50 µg via the nasogastric tube	Four intravenous bolus of 50 mg	Hydrocortisone: four intravenous bolus of 50 mg Fludrocortisone: 50 µg via the nasogastric tube	Intravenous continuous infusion rate without loading dose
Duration	Seven days at full dose	Five days at full dose then tapered to 50 mg intravenously every 12 h for days 6 to 8, 50 mg every 24 h for days 9 to 11, and then stopped	Seven days at full dose	Seven days at full dose, while in the ICU

The divergent findings may have resulted from differences in the design of the trials.

which kind of outcomes may relate to the use of corticosteroids in sepsis patients?

# Activated Protein C and Corticosteroids for Human

Septic Shock (APROCCHSS) trial

Multicenter, Double-blind, Randomized trial with A 2-by-2

factorial design

#### Inclusion criteria

• Patients in intensive care units (ICUs) were eligible for inclusion in the trial if

Mothods

they had indisputable or probable septic shock for less than 24 hours.

- Septic shock:
  - □ the presence of a clinically or microbiologically documented Infection.
  - □ SOFA 3 or 4, at least two organs and at least 6 hours
  - □ Vasopressor therapy (Norepinephrine, Epinephrine, or any other
    - vasopressor at a dose of  $\geq 0.25 \ \mu g \ /kg/min$  or  $\geq 1 \ mg$  per hour) for at least
    - 6 hours

Mothods

hours, a high risk of bleeding, pregnancy or lactation

Underlying conditions that could affect short-term survival, known

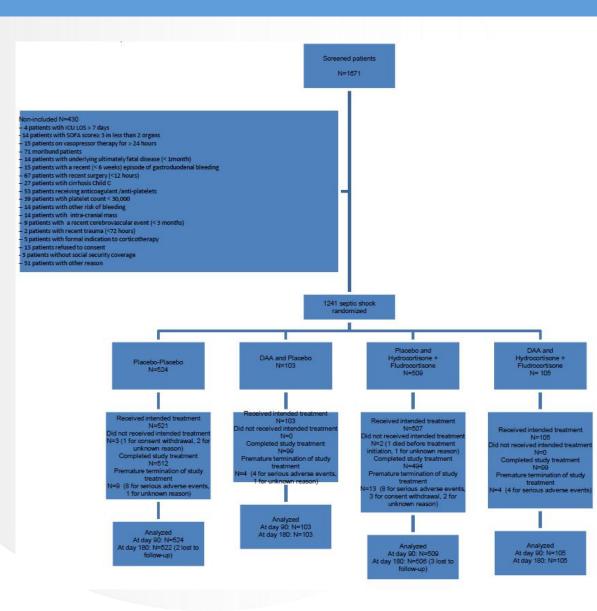

hypersensitivity to drotrecogin alfa (activated),

• Previous treatment with corticosteroids.

#### Summary

 All-cause mortality was lower with hydrocortisone plus fludrocortisone than with placebo at day 90, at discharge from the ICU and hospital, and at day 180.

Discussion

- The time to weaning from vasopressors, to weaning from mechanical ventilation, and to reaching a SOFA score below 6 was shorter with hydrocortisone plus fludrocortisone than with placebo.
- The number of days alive and free of vasopressors and organ failure was higher with hydrocortisone plus fludrocortisone than with placebo.
- The risk of secondary infections, gastroduodenal bleeding, or neurologic sequelae was not significantly higher with hydrocortisone plus fludrocortisone than with placebo, but the risk of hyperglycemia was significantly higher with hydrocortisone plus fludrocortisone.
- There was some imbalance between the two groups in the distribution of pathogens, with slightly more viral infections in the hydrocortisone-plus fludrocortisone group than in the placebo group.

Anticoagulants, brisk variations in blood

pressure, high dose of vasopressors

#### HPA axis in Sepsis

TABLE 1 | Mechanism explaining hypothalamic-pituitary-adrenal axisdisruption in sepsis.

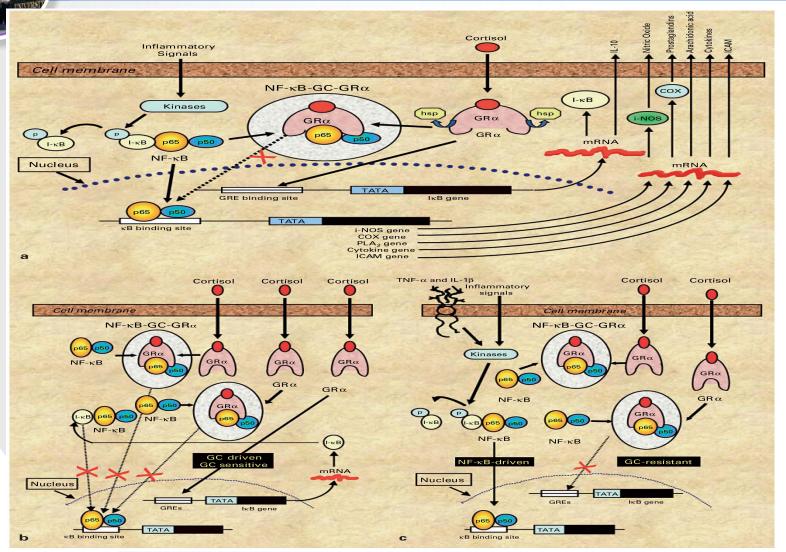

disruption in se	epsis.			hemornage	Coagulopathy, severe hypoxia
HPA axis level	Main mechanisms	Precipitating factors		Decreased	
Hypothalamus	Necrosis or hemorrhage	Anticoagulants, brisk variations in blood pressure, high dose of vasopressors Coagulopathy, severe hypoxia, hyperglycemia		steroidogenesis Depletion of lipid droplets Decreased expression of	Cholesterol-lowering drugs Proinflammatory mediators
	Decreased CRH/AVP synthesis/release	Treatment with corticosteroids, psychoactive drugs Increased brain levels of proinflammatory cytokines (mainly TNF and IL-1) Hypercortisolemia		scavenger receptor B1 Enzymes inhibition	Aminoglutethimide, ketoconazole, fluconazole, etomidate, dexmedetomidine Proinflammatory mediators
Pituitary gland	Necrosis or hemorrhage	Anticoagulants, brisk variations in blood pressure, high dose of vasopressors Coagulopathy, severe hypoxia,		Decreased sensitivity of ACTH receptors	Circulating and adrenals proinflammatory mediators (e.g., corticostatins)
	Decreased ACTH synthesis/release	hyperglycemia Treatment with corticosteroids, psychoactive drugs, anti- infective drugs, megestrol acetate medroxyprogesterone Increased blood levels of proinflammatory cytokines (mainly TNF and IL-1) Coagulopathy, severe hypoxia,	Tissue resistances	Decreased cortisol delivery to tissues Accelerated glucose clearance Decreased binding capacity and affinity of glucocorticoid receptor	Proinflammatory mediators, liver failure, severe denutrition Phenobarbital, phenytoin, rifampin Proinflammatory mediators
		hypercortisolemia	HPA, hypothala	mic–pituitary–adrenal.

\*Results are based on patient responses to a short corticotropin test. Using baseline cortisol, cortisol response, Mc-Cabe classification, Logistic Organ Dysfunction score, arterial lactate levels and Pao<sub>2</sub>/Fio<sub>2</sub> results for adjustment, analyses were performed with use of logistic models. OR indicates, odds ratios; CI, confidence intervals; and ICU, intensive care unit.

- Pacebo-controlled, randomized, double-blind, parallel-group trial
- 19 ICUs in France
- October 9, 1995 to February 23, 1999
- 300 septic shock patients were enrolled
- Hydrocortisone (50-mg IV q6h) and fludrocortisone (50-ug tablet qd) vs. placebo for 7days
- 28d survival distribution in paients with relative adrenal insufficiency (nonresponders)

#### Different results with CORTICUS

- Multicenter, randomized, double-blind, placebo-controlled trial
- 52 ICUs
- March 2002 to November 2005
- 500 septic shock patients were enrolled
- Hydrocortisone (50mg IV q6h) vs. placebo for 5 days
- The dose was then tapered during a 6-day period
- 28d mortality among patients who did not have a response to a corticotropin test

\* Relative risks and percent differences are for the comparison between the hydrocortisone group and the placebo group. P values for categorical variables were calculated with the use of Fisher's exact test. P values for continuous variables were calculated with the use of the Wilcoxon rank-sum test. ICU denotes intensive care unit. N Engl J Med 2008; 358: 111-24

+ Data were missing for one patient.

Data were missing for three patients.

#### Different results with HYPRESS

- Double-blind, randomized clinical trial
- January 13, 2009, to August 27, 2013, with a follow-up of 180 days
- 34 intermediate or ICUs of university and community hospitals in Germany
- 380 adult patients with severe sepsis who were not in septic shock
- Continuous infusion of 200mg of hydrocortisone for 5 days followed by dose tapering until day 11 vs. placebo
- Development of septic shock within 14 days

End Point	Placebo (n = 176)	Hydrocortisone (n = 177)	Total (N = 353)	P Value
Primary				
Septic shock, No./total No. (%) [95% CI]				
ITT population	39/170 (22.9) [17.2-30.0]	36/170 (21.2) [15.6-28.1]	75/340 (22.1) [17.9-26.9]	.70
PP population	33/156 (21.2) [15.4-28.4]	29/155 (18.7) [13.3-25.7]	62/311 (19.9) [15.8-24.8]	.59

Rational 1

Fludrocortisone was added to hydrocortisone to provide additional mineralocorticoid potency

# NF-κB–mediated down-regulation of vascular MR in sepsis

Crit Care Med 2017; 45(9): e954-e962

#### Comparison in 4 different studies

Rational 2

2012 RECOMMENDATIONS			2016 RECOMMENDATIONS					
H. CORTICOSTEROIDS		H. CORTICOSTEROIDS						
1.	Not using IV hydrocortisone to treat adult septic shock patients if adequate fluid resuscitation and vasopressor therapy are able to restore hemodynamic stability (see goals for Initial Resuscitation). In case this is not achievable, we suggest IV hydrocortisone alone at a dose of 200 mg/day (grade 2C).	1.	We suggest against using IV hydrocortisone to treat septic shock patients if adequate fluid resuscitation and vasopressor therapy are able to restore hemodynamic stability. If this is not achievable, we suggest IV hydrocortisone at a dose of 200 mg per day (weak recommendation, low quality of evidence).					
2.	Not using the adrenocorticotropic hormone stimulation test to identify adults with septic shock who should receive hydrocortisone (grade 2B).							
3.	In treated patients, hydrocortisone tapered when vasopressors are no longer required (grade 2D).							
4.	Corticosteroids not be administered for the treatment of sepsis in the absence of shock (grade 1D).							
5.	When hydrocortisone is given, use continuous flow (grade 2D).							

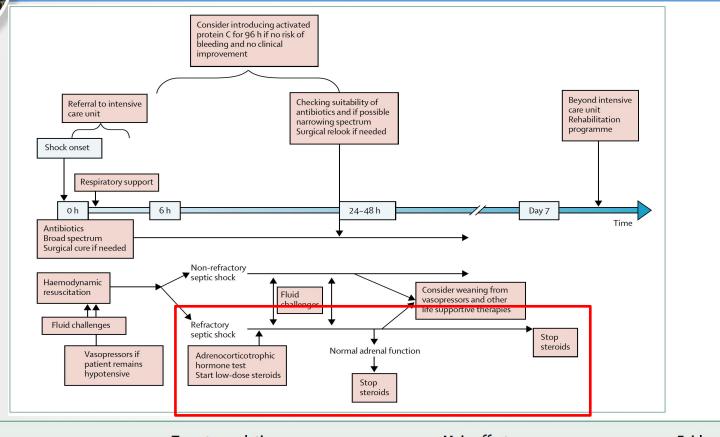

#### 2008 Steroids

- Consider intravenous hydrocortisone for adult septic shock when hypotension responds poorly to adequate fluid resuscitation and vasopressors (2C)
- ACTH stimulation test is not recommended to identify the subset of adults with septic shock who should receive hydrocortisone (2B)
- Hydrocortisone is preferred to dexamethasone (2B)
- Fludrocortisone (50 μg orally once a day) may be included if an alternative to hydrocortisone is being used that lacks significant mineralocorticoid activity. Fludrocortisone if optional if hydrocortisone is used (2C)
- $\circ$  Steroid therapy may be weaned once vasopressors are no longer required (2D)
- Hydrocortisone dose should be  $\leq$ 300 mg/day (1A)
- Do not use corticosteroids to treat sepsis in the absence of shock unless the patient's endocrine or corticosteroid history warrants it (1D)

Intensive Care Med 2017; 43: 304-77 Crit Care Med 2008; 36: 296-327

#### Refractory septic shock – best target group for corticosteroids

**Target population** 

**Main effects** 

Evidence

#### Replacing or enhancing host responses

- **Endocrine response**
- Low-dose corticosteroids

Refractory septic shock and basal cortisol concentrations <150  $\mu$ q/L or cortisol response to adrenocorticotrophin <90 μg/L

Improve haemodynamics; reduce shock 5 RCTs (n=465) duration, organ dysfunction, systemic inflammation, and mortality

1 continuing RCT (n=800)

Lancet 2005; 365: 63-78
